Github Cheat Sheet

1. Initialize a repository

```
git init
```

Creates a new local Git repository in the current folder.

2. Connect to a remote repository

```
git remote add origin <url>
```

Links your local project to a remote repository (e.g., GitHub).

3. Clone a repository

```
git clone <url>
```

Copies an existing remote repository to your local machine.

4. Check repository status

```
git status
```

Shows the current state of the working directory and staging area.

5. Add files to staging area

```
git add .
```

Adds all changes to the staging area ready for commit.

6. Commit changes

```
git commit -m "message"
```

Saves changes to the repository with a descriptive message.

7. Push changes to remote

```
git push origin <branch>
```

Uploads local commits to the remote repository.

8. Pull changes from remote

```
git pull origin <branch>
```

Updates your local repository with the latest changes from remote.

9. Create a new branch

```
git branch <branch-name>
```

Creates a new branch for separate development.

10. Switch branches

```
git checkout <branch-name>
```

Moves to another branch in the repository.

11. Create and switch to a new branch

```
git checkout -b <branch-name>
```

Creates a new branch and switches to it immediately.

12. Merge branches

```
git merge <branch-name>
```

Combines changes from one branch into the current branch.

13. Rename a branch

```
git branch -m <new-name>
```

Renames the current branch.
